Question and Answer Session

How to submit or ask questions for the panel members?

Submit or Ask Questions

- Submit your text question and comments using the Question Panel
- Please raise your hand to be unmuted for verbal questions.

FHIR for Public Health

Grahame Grieve, Paula Braun. Sept 15th 2016

What is FHIR?

- Standard for Healthcare Data Exchange
 - A base on which to build clinical interoperability

Clinical Interoperability

 IEEE Definition: "the ability of two or more systems or components to exchange information and to use the information that has been exchanged"

 My Definition: "the ability of two or more clinical teams to exchange patients and provide seamless care"

What is FHIR?

- Standard for Healthcare Data Exchange
 - A base on which to build clinical interoperability
- Developed and published by HL7 under an open source licence
- Rapidly becoming the standard of choice for all integration projects
 - And we're not even done yet!

The FHIR acronym

- F Fast (to design & to implement)
- H Health
- I Interoperable
- R Resources

- FHIR is a technical specification
- FHIR is a community of implementers, a culture

FHIR – Web API for healthcare

- Uses Web Technologies
 - JSON / HTTP
 - Resources / RESTful API
 - URIs / linked data / semantic web
 - Aligns with other web standards
- Web community
 - Social Media, Open License
- Health Community
 - Connected with existing HL7 content and processes
 - Supports more than just RESTful API

```
<Patient xmlns="http://hl7.org/fhir">
                                                                                                                                                                                                                                                               Resource

Readable Summary

Extension with reference to its definition

Content: · MRN

 Name Gender

· Date of Birth

Provider

Why did we do FHIR?

- Healthcare has many broken processes
 - in spite of high commitment by all parties
- Transformation needs to come to healthcare
 - as it has (or is) in other industries
- Transformation has many blockers, but one key pre-requirement is digital exchange standards that can create network effects

Network Effect Requirements

- Based on Web API technology
- Open license
- Simple definitions
- Pragmatic, not based on dogma
- Cheap to implement
- Strong community supporting adoption
- Lots of open source tools to leverage API

FHIR & Cost of Integration

- FHIR is Easier & Faster (stand on the shoulder of giants)
 - Re-uses technology & Community (Facebook, Google, Twitter etc)
 - Skills & Libraries are easily available, Content is free
 - Community is highly active and open
 - RESTful API is robust
 - Solid open source implementation tooling
- These factors will drive down the cost of integration and interoperability
 - Easier to Develop / Troubleshoot / Leverage in production
 - More people to do the work

FHIR & Market Consequences

- FHIR is a cheaper way to get things done preferable
- Competing approaches will have to match the cost, or disappear
- FHIR is a brand new approach
 - Is it really worth doing something brand new?
 - Initial response from community members is always negative
 - Drive to adopt FHIR comes from outsiders
 - Classic change process problem

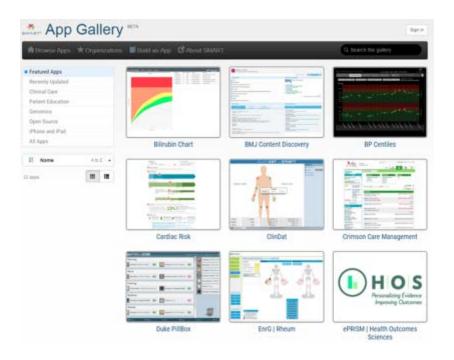

Adoption

- FHIR is a draft standard
- A 'beta' standard, subject to ongoing change
- In spite of this, it is being adopted quickly
 - Government projects + large consortiums (Argonaut, S4S, HSPC)
 - European national projects & Health Records
 - National Terminology Service
 - Many vendor and open source projects
 - In-production systems for 3+ years
- There is still v2 and CDA work
 - But moving towards the tail end of the standards process

Implementation Stack Using FHIR

- FHIR a platform for interoperability (general use, very optional)
- DAF A common way to find/access the data
- Argonaut Common access to EHR data for patient/clinical portals
- S4S working profile on argonaut for research synchronization
- HSPC / CIMI / lots of other work : make data itself consistent

SMART-On-FHIR Applications

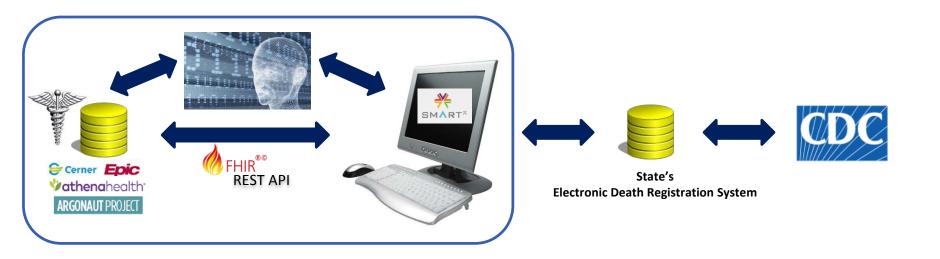

Death Reporting on FHIR

Powerful & Flexible Tool to Help Physicians Determine Chain of Events that Led to Death

- + Integrate Into Physicians' Workflow: Certify Deaths in the EHR & Send Electronically to State
 - + <u>Save Time</u>: Provide <u>Medical History & Pre-Populate</u> Demographic/Basic Health Information
 - + Improve Accuracy: Use Advanced Computing to Help Determine Cause-of-Death Sequence
 - + Advance Medical Research & Improve Care: Send Coded Data Back to EHR

Patient Info

Funeral Home Contacts

Manner of Death

Demographic Data

Circumstances of Death

Pronouncing Clinician

Causes of Death

Certifying Medical Professional

Composition (Entry[0]) ILE. STAND AND CERTIFICATE OF DEATH Related Person · Date/Time: as filed/produced · Type: D.C. Cod e able Concept <Surviving spouse if applicable> Section → text: Summary (xhtml) Pa bent NAME OF STREET Patient (Entry[1]) Related Person <Patient information> <Mother> Pagent Questionnaire Response (Entry[2]) Related Person HID PROMOLING PE OR CERTIFIED PATH <Question answers> <Father> Parjent Practitioner (Entry[3]) Related Person <Informant> (for Pronouncing Dead) Patjent BUNDLE <Certifier information> Type: doc Total: int[1] Practitioner (Entry[4]) Sign ature: (for Filling Death Certificate) <Certfier information> Practitioner (Entry[5]) · <Fun eral agent information> Location (Entry[6]) <Place of death> Observation (Upto 4) Onset [period]

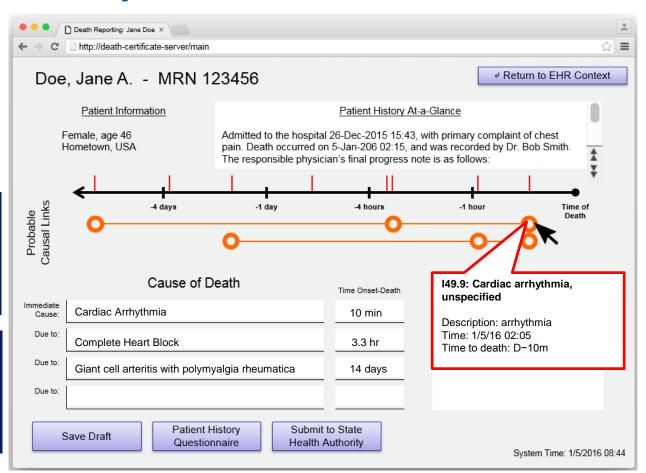

<Cause of death>

Provide History at-a-Glance & Probable Causal Links

Basic patient information, to give context. Seamless return to EHR for more info.

Scroll-able, scale-able timeline for comprehensive view

Familiar chainof-events layout, allowing changes if needed

Salient plantext history, with final progress note if available

Hover over events for more details

Clicking on a proposed timeline prepopulates the chain of events

Validate Data Before Sending to State

FHIR Applications to Address Childhood Obesity

Documentation

Tools to Explore

MIRTH Connect now offers a FHIR Listener Connector https://www.nextgen.com/Interoperability/Mirth-Solutions/Connect-Overview

Tools like Aidbox (http://health-samurai.io/products) can serve as a backend, data repository, provide REST APIs, and act as an integration bus

Matthew Spielman of Intersystems presented a tool called CCDA Shredder at the HL7 roundtable at Harvard in July (http://www.hl7.org/events/roundtable072016/program.cfm). As he presented it, you input a CCDA document and you get FHIR Resources. This could be one approach to help think through how to map existing CDA IGs to FHIR.
